Fundamentals of Detection Theory

Binary and Multi-Hypothesis Detection

Detection theory involves deciding between competing hypotheses based on observed data. The simplest scenario is binary detection, where a signal may be present (H_1) or absent (H_0). Key Concepts:

Likelihood Ratio Test (LRT):

The optimal test for binary detection under Neyman-Pearson criterion.

Decision Rules:

Detection Performance Metrics

The effectiveness of detection schemes is gauged by specific metrics:

- Probability of Detection (P_D):** The likelihood of correctly detecting the presence of a signal.
- Probability of False Alarm (P_{FA}):** The likelihood of incorrectly signaling detection when no signal is present.
- Probability of Missed Detection (P_M):** The likelihood of missing a real signal.

Receiver Operating Characteristic (ROC) Curve:

Optimal Detectors and Their Design

Designing optimal detectors involves maximizing detection probability for a given false alarm rate. The Neyman-Pearson lemma states that the likelihood ratio test provides this optimality under certain conditions.

Likelihood Ratio (Λ)

$$\Lambda = \frac{p(\mathbf{r}|H_1)}{p(\mathbf{r}|H_0)}$$

Decision Rule:

Decide H_1 if $\Lambda > \eta$
Decide H_0 otherwise

Parameter estimation often accompanies detection to improve decision accuracy, especially in noisy environments.
